### Import Data Using Transform Map (Spreadsheet):

Project team shall fill the following information in the import data using Transform Map template.

| S.No. | Parameter           | Values                                                                                                                                                      | Screenshot                                                                                                                                               |
|-------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.    | Import Data Summary | Spreadsheet data is loaded into an Import Set Table and prepared for transformation into the target ServiceNow table.                                       |  <p style="text-align: center;">Load Data / Spreadsheet</p>           |
| 2.    | Field Mapping       | Source fields are mapped to target fields using Auto Map Matching Fields / Mapping Assist.<br>Example: Name → Name, Email → Email, Department → Department. |  <p style="text-align: center;">Transform Map / Field Mapping</p>    |
| 3.    | Transform Result    | Transform completed successfully; imported records are available in the target table and Transform History shows no row errors.                             |  <p style="text-align: center;">Transform Success / Verification</p> |
